

..use to water the garden

..flush the toilet

..store in a water butt

..welcome to **hydro²SAVE**

from Hydrosaveonline

■ SAVING WATER - AND THE ENVIRONMENT

You simply fit the unit onto the water pipe that feeds the hot tap of your sink, wash basin or shower, tell the sensor how hot you want your water to begin flowing and any water below that temperature is cleverly diverted outside your home, for you to use when and how you wish.

There are other advantages too: Your preferred temperature at the shower means that there are no longer any cold surprises waiting for you under the shower head! The Hydrosave will also tell you automatically if the water flowing into your sink gets too hot, a useful safety feature should little hands suddenly volunteer to help with the washing up!

Although the unit will save you money in the long run, it's the environmental savings that seem to have captured people's imagination.

■ WHAT OUR CUSTOMERS HAVE TO SAY!

"My husband would water our vegetable garden and flower beds every day, but when we fitted the Hydrosave, we just connected a garden hose with a few holes in to the valve and now the garden waters itself each time we make a cup of tea - brilliant!"

"I decided to divert my water into a water butt with a hose attached to the base. My son goes mountain biking at weekends and always comes back muddy. I just liked the idea of washing his bike down with water I would otherwise have just poured down the drain, it does a great job!"

"We use our saved water to automatically fill the toilet cistern. We were surprised just how much our water bill came down!"

A battery operated control unit is also available for locations where a mains supply is not convenient.

Did you know

that yesterday
you wasted over 6 litres of clean pure water
by pouring it straight down your drain!

- and you'll do the same again tomorrow

In fact you've always done it, wasting a staggering 2,200 litres of pure clean water in your household, every year. We all do it, day in-day out.

Most of us run our hot taps until the water is warm before we put the plug in, fill the kettle or step into the shower and that unused water, (nationally, millions of gallons each year), is just poured down the drain.

..until now!

introducing the remarkable
